

LANZONI s.r.l.

BIRD DETERRENTS

Assembly instructions

Cleaning

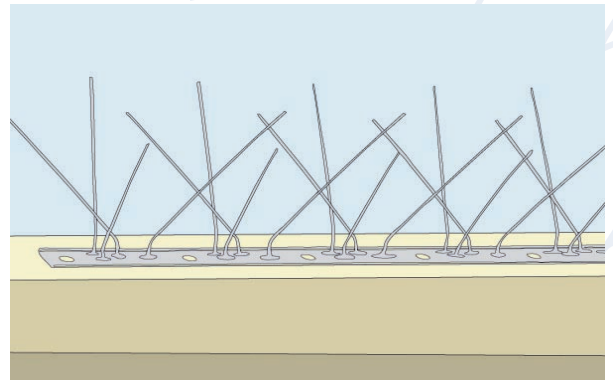

Remove dirt (excrements, paint and not settled or detached coating, etc.) by using a scratcher and/or a metal brush and remove grease by means of special solvents.

Surfaces must be clean and dry.

Positioning

Position the bird deterrents on the surface by keeping to the general instructions for the coverage of the areas to protect.

Fastening

The bird deterrents can be assembled with silicone, thread-cutting screws, dowels, rivets, nails, clamps, etc. according to the surface features.

When possible, it is recommended to apply a silicone layer to overcome the swelling differences between bird deterrents and support in the ranges of temperature.

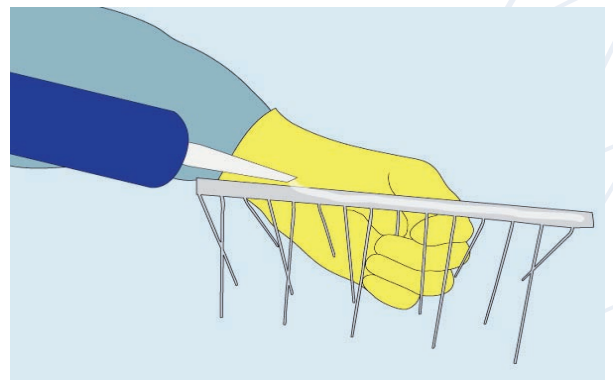

Glue fastening

Apply an adhesive layer along the bird deterrent base.

Firmly press the bird deterrent on the surface, on which it shall be applied, so that the glue comes out of the base holes.

Wait for the recommended time shown on the adhesive package before touching the piece.

Maintenance

Regularly check through sight control whether there are debris on the spikes or detached deterrent parts and clean and repair them, if necessary.
